Microsoft Entra ID Lab Report

Employee Onboarding and Group Access Management

Project Date: October 31, 2026
Project Status: Completed
Platform: Microsoft Entra ID
Company: Stevenson Technologies (Fictional)

---

1. Project Objective

The objective of this lab was to gain hands-on experience using Microsoft Entra ID to perform basic identity and access management tasks.

I simulated an employee onboarding process for a fictional company called Stevenson Technologies. The project involved creating a new employee account, creating a department security group, assigning the employee to that group, and reviewing the employee's account properties.

2. Business Scenario

Stevenson Technologies hired a new employee named Jordan Smith as an IT Support Technician in the Information Technology department.

As part of the onboarding process, the employee needed an account in Microsoft Entra ID and membership in the appropriate department security group.

I completed these tasks to simulate how an IT support technician might handle basic employee onboarding.

3. Tools and Technologies

- Microsoft Entra admin center
- Microsoft Entra ID Free
- Web browser
- Google Docs for documentation
- GitHub for project publishing

4. Environment

This project was completed using my personal Microsoft Entra ID environment.

The company and employee used in this lab are fictional. No real company employee accounts were managed.

5. Tasks Performed

Task 1: Accessed Microsoft Entra Admin Center

I signed into the Microsoft Entra admin center and reviewed the dashboard and available identity management features.

Result: Successfully accessed the Microsoft Entra admin center.

Task 2: Created an Employee Account

I created a user account for Jordan Smith.

The account was configured with the following information:

Property	Value
Name	Jordan Smith
First Name	Jordan
Last Name	Smith
Job Title	IT Support Technician
Department	Information Technology
Company	Stevenson Technologies

Result: The user account was successfully created and located in the user directory.

Task 3: Verified the Employee Account

After creating the account, I navigated to the All Users section and searched for Jordan Smith.

I opened the account to review the employee's information and properties.

Result: Successfully located the account and reviewed its properties.

Task 4: Created a Security Group

I created a security group named `IT-Department`.

The group was configured with these settings:

Setting	Value
Group Type	Security
Group Name	IT-Department
Description	Group for Information Technology employees
Membership Type	Assigned
Microsoft Entra Roles	No

Result: Successfully created the IT-Department security group.

Task 5: Added the Employee to the Security Group

I opened the IT-Department group and added Jordan Smith as a member.

This demonstrated how an organization can organize employees through department-based security groups.

Result: Jordan Smith was added to the IT-Department group.

Task 6: Reviewed Account Properties

I reviewed Jordan Smith's account information to make sure the employee details were configured correctly.

This included reviewing the display name, first name, last name, job title, department, and company information.

Result: Reviewed the employee account properties.

6. Results and Verification

The lab demonstrated the basic employee onboarding process using Microsoft Entra ID.

The following tasks were completed:

- Accessed Microsoft Entra admin center.
- Created a fictional employee account.
- Located and reviewed the employee account.
- Created an IT department security group.
- Added the employee to the security group.
- Reviewed the employee's account properties.

7. Security Relevance

Identity and Access Management helps organizations control who can access company resources.

Security groups make it easier to organize users and manage access based on department responsibilities.

This lab demonstrated several important IAM concepts:

- User account administration
- Group-based access management
- Employee onboarding
- Identity organization
- Least privilege principles

A security group does not automatically grant access to every company resource. Permissions must be configured separately for the resources the group needs to access.

8. Challenges and Troubleshooting

One challenge was locating the newly created employee account after submitting the creation form.

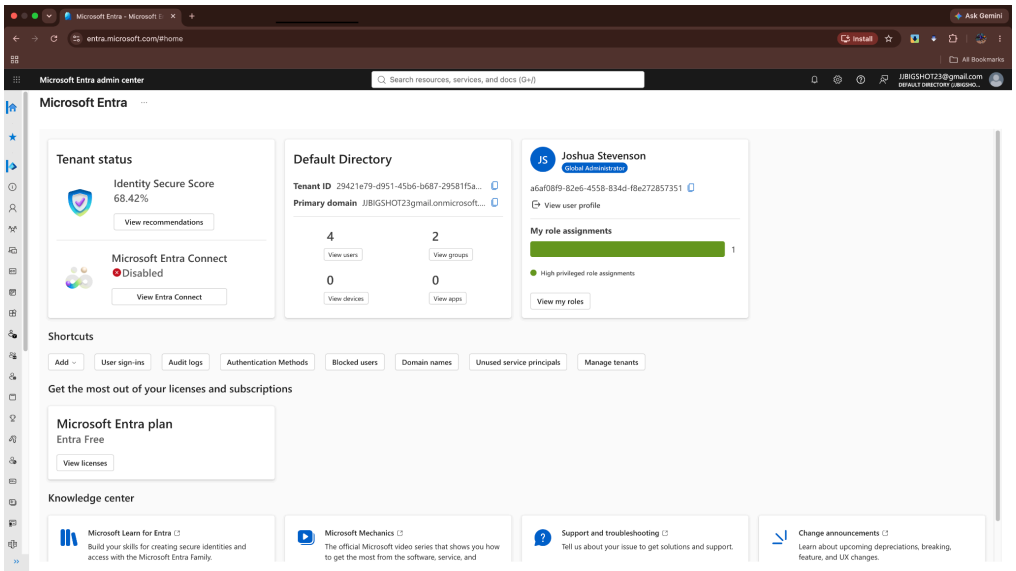

I resolved this by navigating to All Users and searching for Jordan Smith. I was able to locate the account and continue with the onboarding process.

I also reviewed the employee's account properties to make sure the information matched the fictional onboarding scenario.

9. Screenshots and Evidence

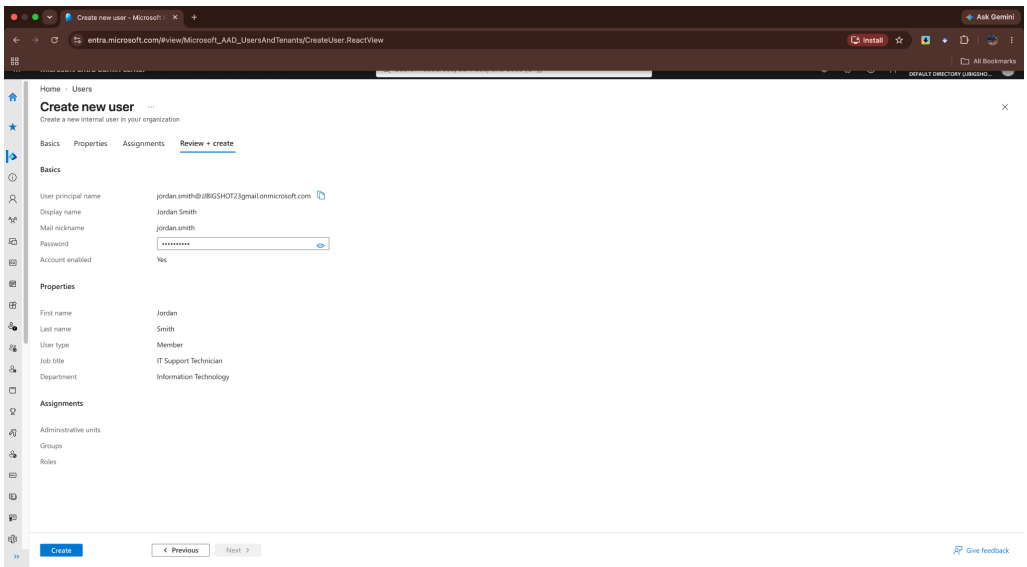

The following screenshots document the work completed during the lab.

Screenshot 1: Entra Admin Center Dashboard

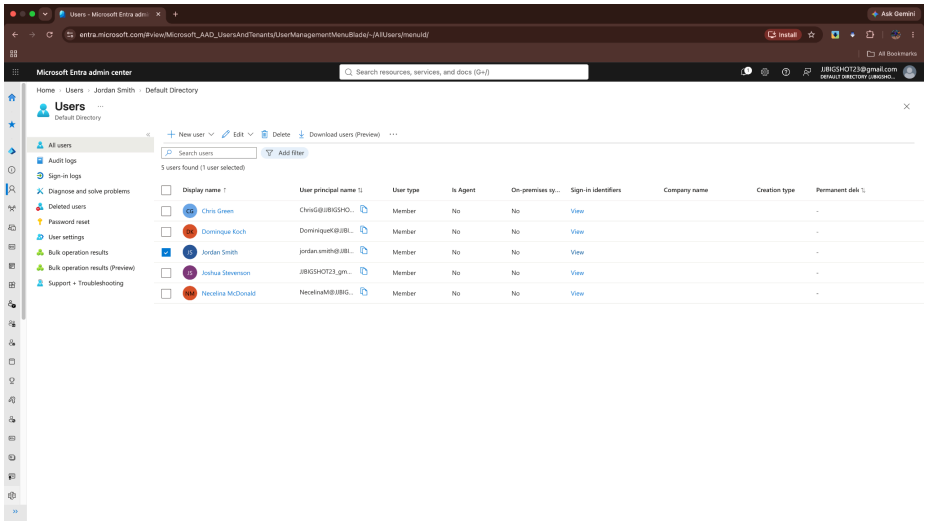

Shows access to the Microsoft Entra admin center.

Screenshot 2: Employee Creation Form

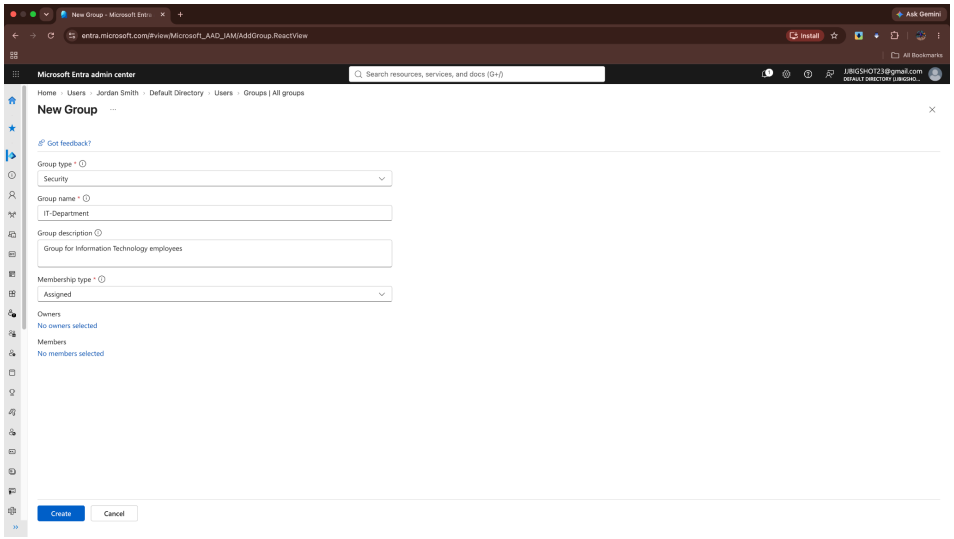

Shows the information entered when creating Jordan Smith's account.

Screenshot 3: User Directory Verification

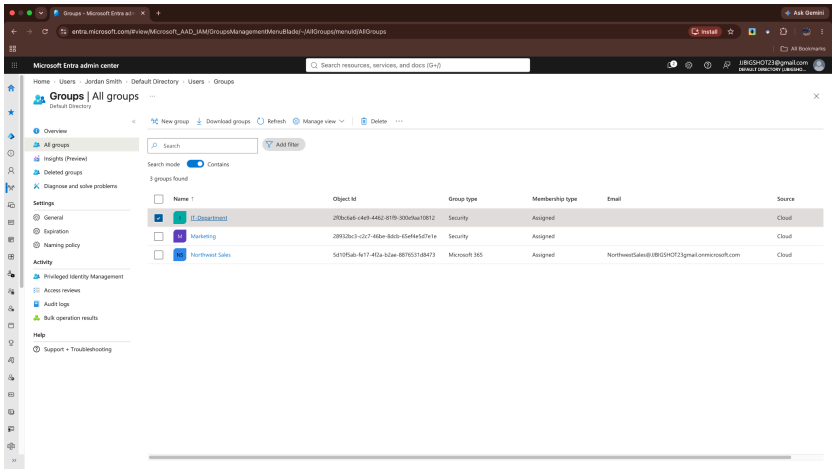

Shows Jordan Smith listed in the user directory.

Screenshot 4: Security Group Creation Form

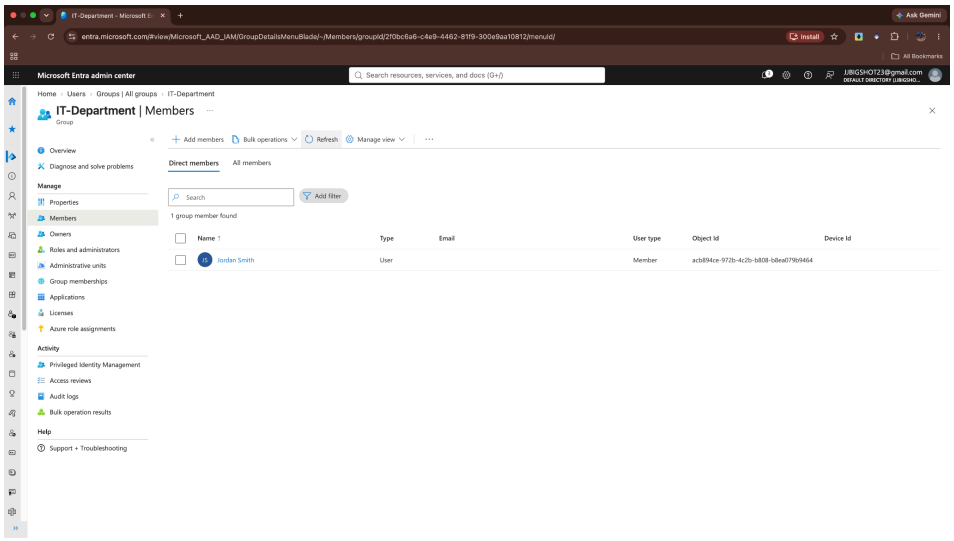

Shows the configuration used to create the IT-Department security group.

Screenshot 5: Security Group Created

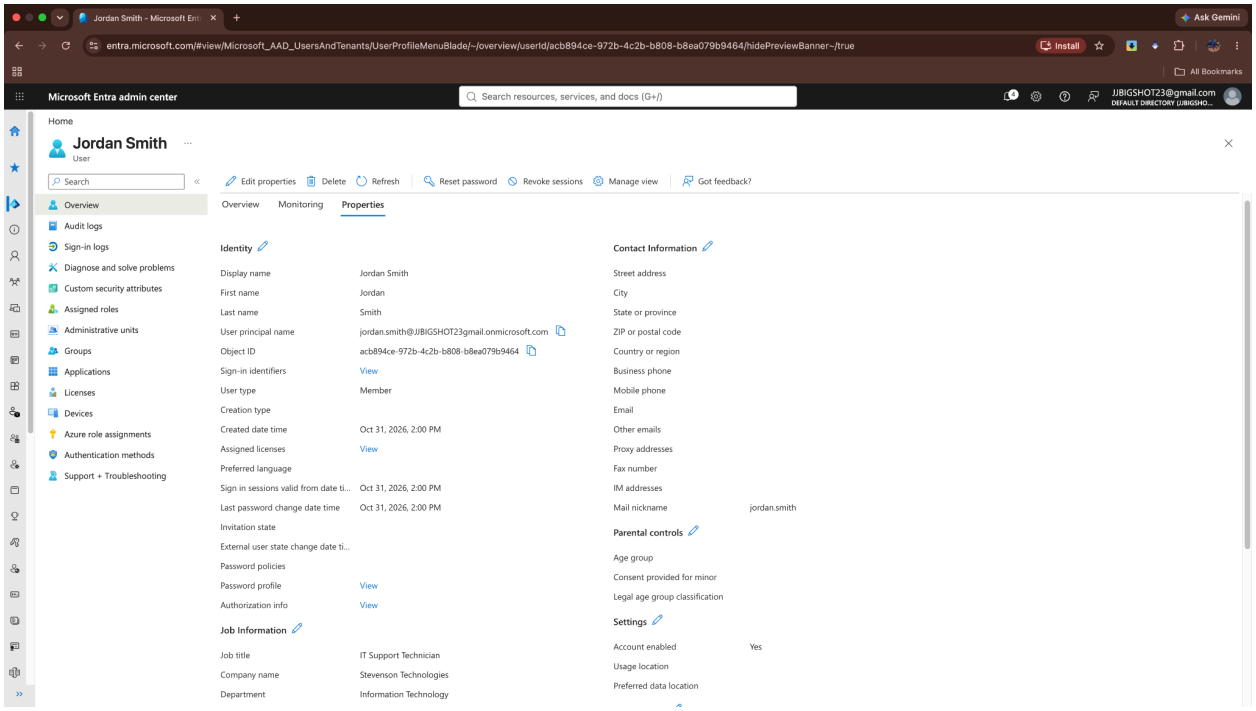

Shows the IT-Department group in Microsoft Entra ID.

Screenshot 6: Group Membership

Shows Jordan Smith added as a member of the IT-Department group.

Screenshot 7: Employee Account Properties

Shows the employee account information reviewed during the lab.

10. Skills Demonstrated

- Microsoft Entra ID navigation
- User account creation and administration
- Security group creation
- Group membership management
- Employee onboarding procedures
- Account property review
- Basic identity and access management
- Technical documentation

11. What I Learned

This project helped me understand how Microsoft Entra ID can be used to manage employee identities and organize users into security groups.

I gained hands-on experience creating user accounts, managing group membership, and reviewing account information.

I also learned how group-based access management can help organizations organize employees and manage permissions more efficiently.

12. Future Improvements

To build on this project, I plan to practice additional identity management tasks, including:

- Disabling and re-enabling employee accounts.
- Simulating employee offboarding.
- Reviewing sign-in logs.
- Exploring access reviews.
- Learning more about Microsoft Entra ID roles and permissions.
- Practicing automation for user onboarding and offboarding.

13. Conclusion

This project provided practical experience with basic Microsoft Entra ID administration and identity management.

By completing the simulated employee onboarding process, I developed a better understanding of how IT professionals create user accounts, organize employees into security groups, and review identity information.

This project is part of my continued learning in IT support, identity and access management, and cloud security.

Project Disclaimer: Stevenson Technologies and Jordan Smith are fictional and were created for educational purposes. This was a personal hands-on learning lab and does not represent professional employment or administration of a real company's identity environment.
